

# Regular Expression in SQL Server

Madhivanan, MVP (SQL Server)  
madhivanan2001@gmail.com

Professional Association for SQL Server

## Definition

Regular expressions provide better way of matching strings of text, such as particular characters, words, or patterns of characters.

Also referred as

- \* Regex
- \* Regexp

# How to use Regular expression in SQL Server?

- \* **A bracket expression.**

- \* [abc] matches "a", "b", or "c". [a-z] specifies a range which matches any lowercase letter from "a" to "z". These forms can be mixed: [abcx-z] matches "a", "b", "c", "x", "y", or "z", as does [a-cx-z].
- \* [ABC] matches "A", "B", or "C". [A-Z] specifies a range which matches any uppercase letter from "A" to "Z". These forms can be mixed: [ABCX-Z] matches "A", "B", "C", "X", "Y", or "Z", as does [A-CX-Z].
- \* [0-9] matches any digit from 0 to 9
- \* [67] matches digit either 6 or 7
- \* [^g] matches any character other than g
- \* [^7-9] matches any character other than digits 7,8 and 9

# Pseudo code

- \* **To check if data has first four characters as alphabets**

where col like '[a-z][a-z][a-z][a-z]%'

- \* **To check if data has first four characters as alphabets followed by two digits followed by alphabet S**

where col like '[a-z][a-z][a-z][a-z][0-9][0-9][S]%'

- \* **To check if data ends with alphabet**

where col like '%[a-z]'

# Examples with sample data

- \* **To check if data has atleast a digit**

where col like `'%[0-9]%'`

- \* **Only numerics**

where data not like `'%[^0-9]%'`

# Example code

```
declare @sample_table table (data varchar(100) primary key)
insert into @sample_table (data)
select 'This is my new car' union all
select 'Be careful' union all
select 'This red car is very nice' union all
select 'carpets are there' union all
select 'Nothing' union all
select 'Ok. Thank you' union all
select 'My address is No 34, New Main Road, Chennai - 600045' union all
select 'Please call me at 9444572716' union all
select '9444572716'
```

# Query

```
Select * from @sample_table
```

## Result

---

This is my new car

Be careful

This red car is very nice

carpets are there

Nothing

Ok. Thank you

My address is No 34, New Main Road, Chennai - 600045

Please call me at 9444572716

9444572716

**--Give data that has the word car**

```
select * from @sample_table  
where data like '%car%'
```

Result

---

```
This is my new car  
Be careful  
This red car is very nice  
carpets are there
```

**--Give data that has car immediately followed by atleast 4 characters**

```
select * from @sample_table  
where data like '%car[a-z][a-z][a-z][a-z]%'  
--or  
select * from @sample_table  
where data like '%car[a-zA-Za-zA-Za-zA-Z]%'
```

Result

---

Be careful  
carpets are there

**--Get data that has atleast a digit**

```
select * from @sample_table  
where data like '%[0-9]%'
```

Result

---

My address is No 34, New Main Road, Chennai - 600045  
Please call me at 9444572716  
9444572716

**--Get data that has not only digits but any characters too**

```
select * from @sample_table  
where data like '%[^0-9]%'
```

Result

---

This is my new car

Be careful

This red car is very nice  
carpets are there

Nothing

Ok. Thank you

My address is No 34, New Main Road, Chennai - 600045

Please call me at 9444573716

<http://www.sql-articles.com>

**--Get data that has only digits**  
select \* from @sample\_table  
where data not like '%[^0-9]%'

Result

---

9444572716

# More examples

## Example1

**Extract data that has number in the format  
Ddd-ddd-dddd (d denotes a number from 0 to 9)**

```
declare @sample_data table(data varchar(100))
insert into @sample_data(data)
select 'I am on the way. Note my number is 87-883-0114 and right now.....' as data union
all
select 'Well done. Contact this number 345-245-9871 and let me know.....!'
```

```
Select * from @sample_data
```

Result

```
-----
I am on the way. Note my number is 87-883-0114 and right now.....
Well done. Contact this number 345-245-9871 and let me know.....
```

## Query

```
select
  data
from
  @sample_data
where
  patindex('%[0-9][0-9][0-9][-][0-9][0-9][0-9][-][0-9][0-9][0-9][0-9]%',data)>0
```

## Result

---

Well done. Contact this number 345-245-9871 and let me know.....

## \* Extracting the contact number

```
select
    substring(data,patindex('%[0-9][0-9][0-9][-][0-9][0-9][0-9][-][0-9][0-9][0-9][0-9]%',data),12) as ph_no
from
    @sample_data
where
    patindex('%[0-9][0-9][0-9][-][0-9][0-9][0-9][-][0-9][0-9][0-9][0-9]%',data)>0
```

Result

---

345-245-9871

## Example 2

### Extract amount prefixed by \$

```
declare @sample_data table(data varchar(100))
insert into @sample_data(data)
select '9 Lemons cost 67 $99.99 on sale' as fruit union all
select '$5.99 Apples 877 are on sale' union all
select 'Where are the $65.99 lemons 7856' union all
select 'Oranges costs $99.5' union all
select ' and this costs 98.24'
```

Select \* from @sample\_data

## Result

---

9 Lemons cost 67 \$99.99 on sale  
\$5.99 Apples 877 are on sale  
Where are the \$65.99 lemons 7856  
Oranges costs \$99.5  
and this costs 98.24

## Get data that has \$ as part of it

```
select
    data,
    substring(data,charindex('$',data),len(data)) as amount
from
    @sample_data
where
    data like '%$%'
```

### Result

| Data                              | amount                        |
|-----------------------------------|-------------------------------|
| 9 Lemons cost 67 \$99.99 on sale  | \$99.99 on sale               |
| \$5.99 Apples 877 are on sale     | \$5.99 Apples 877 are on sale |
| Where are the \$65.99 lemons 7856 | \$65.99 lemons 7856           |
| Oranges costs \$99.5              | \$99.5                        |

## Get the amount

```
select data,substring(amount,1,patindex('%[0-9][ ]%',amount+' ')) as amount from  
(  
    select  
        data,  
        substring(data,charindex('$',data),len(data)) as amount  
    from  
        @sample_data  
    where  
        data like '%$%'  
) as t
```

## Result

---

|                                   |         |         |
|-----------------------------------|---------|---------|
| 9 Lemons cost 67 \$99.99 on sale  | \$99.99 |         |
| \$5.99 Apples 877 are on sale     | \$5.99  |         |
| Where are the \$65.99 lemons 7856 |         | \$65.99 |
| Oranges costs \$99.5              | \$99.5  |         |

# Benefits of Regular expression

- \* Better way of pattern matching
- \* Less coding
- \* Index usage which improves performance

# Less Coding

--Give data that starts with four lowercase alphabets  
Without using Regular expression

```
select * from @sample_table
where substring(data,1,1) in ('a','b','c',.....'z') And substring(data,2,1) in
('a','b','c',.....'z')
And substring(data,3,1) in ('a','b','c',.....'z') And substring(data,4,1) in
('a','b','c',.....'z')
```

Result

---

This is my new car  
This red car is very nice  
carpets are there

Nothing

## Using Regular Expression

```
select * from @sample_table  
where data like '[a-z][a-z][a-z][a-z]%'
```

### Result

---

```
This is my new car  
This red car is very nice  
carpets are there  
Nothing  
Please call me at 9444572716
```

# Index usage

## Get data where first character is b, c or t

Usual method

```
select * from @sample_table  
where substring(data,1,1) in ('b','c', 't')
```

Result

---

This is my new car  
Be careful  
This red car is very nice  
carpets are there

# Table Scan

The screenshot displays the Microsoft SQL Server Management Studio interface. The main window shows a query plan for a query that scans a table. The query is: `select * from @sample_table where substring(data,1,1) in ('b','c','t')`. The query plan shows a **SELECT** operator with a cost of 0, which is connected to a **Clustered Index Scan** operator with a cost of 100. A tooltip is open over the **Clustered Index Scan** operator, providing detailed information about the scan operation.

Query 1: Query cost (relative to the batch): 100%

```
select * from @sample_table where substring(data,1,1) in ('b','c','t')
```

**SELECT**  
Cost: 0 %

**Clustered Index Scan**  
Cost: 100 %

**Clustered Index Scan**  
Scanning a clustered index, entirely or only a range.

| Physical Operation       | Clustered Index Scan |
|--------------------------|----------------------|
| Logical Operation        | Clustered Index Scan |
| Estimated I/O Cost       | 0.003125             |
| Estimated CPU Cost       | 0.0001581            |
| Estimated Operator Cost  | 0.0032831 (100%)     |
| Estimated Subtree Cost   | 0.0032831            |
| Estimated Number of Rows | 1                    |
| Estimated Row Size       | 61 B                 |
| Ordered                  | False                |
| Node ID                  | 1                    |

**Predicate**  
substring([data],(1),(1))='t' OR substring([data],(1),(1))='c' OR substring([data],(1),(1))='b'

**Object**  
[@sample\_table].[PK\_#10818984\_\_1175ADBD]

**Output List**  
data

## Regular expression

```
select * from @sample_data  
where data like '[bct]%'
```

## Result

---

```
This is my new car  
Be careful  
This red car is very nice  
carpets are there
```

# Table Seek

The screenshot displays the Microsoft SQL Server Management Studio interface. The main window shows a query plan for a query: `select * from @sample_table where data like '[bct]%'`. The query cost is 100%. The execution plan indicates a **Clustered Index Seek** operation with a cost of 100%. The details pane on the right provides the following information:

**Clustered Index Seek**  
Scanning a particular range of rows from a clustered index.

|                                 |                      |
|---------------------------------|----------------------|
| <b>Physical Operation</b>       | Clustered Index Seek |
| <b>Logical Operation</b>        | Clustered Index Seek |
| <b>Estimated I/O Cost</b>       | 0.003125             |
| <b>Estimated CPU Cost</b>       | 0.0001581            |
| <b>Estimated Operator Cost</b>  | 0.0032831 (100%)     |
| <b>Estimated Subtree Cost</b>   | 0.0032831            |
| <b>Estimated Number of Rows</b> | 1                    |
| <b>Estimated Row Size</b>       | 61 B                 |
| <b>Ordered</b>                  | True                 |
| <b>Node ID</b>                  | 0                    |

**Predicate**  
[data] like [bct]%

**Object**  
[@sample\_table].[PK\_\_#10818984\_\_1175AD8D]

**Output List**  
data

**Seek Predicates**  
Start Range: data >= Scalar Operator('Ã...  
Ã%Ã%Ã%Ã%Ã%Ã%'), End Range: data < Scalar Operator('U')

Thank You
